RISK POSTURE

WARNING

position heat 64% / 80% —
within budget

SECTION 02 — WHY THE SYSTEM LOOKS THIS WAY

Operating Premise

Three commitments shape every component below.

01 — REGIME FIRST

Classify the market before sizing the trade.

Kelly multiplier is scaled by regime. Same signal, different size — that is the whole game.

02 — MULTI-FACTOR

No single indicator may fire an alert.

Confluence is a composite of six factors. One bright line cannot carry a candidate.

03 — GATE IS FINAL

Risk gate has the last word — always.

Four budgets. Any one trips and the candidate is rejected. The signal does not override the gate.

PIPELINE • SINGLE DIRECTION • NO LOOPS

System Architecture

Market data feeds stages 1 and 2 in parallel. Both inputs converge at the gate. Operator sees stages 1–3 on the dashboard; stage 4 is the bot.

4 STAGES • 12 SYMBOLS

STAGE 01 OF 04

Signal Layer

Six-factor composite. Confluence is the headline number; regime alignment, breaker state, and Kelly sizing live inside.

EXECUTE

confluence $\geq$ 80 · gate PASS

CONSIDER

confluence 65–79 · verify regime

SKIP

confluence < 65 · stand down

HALT

gate FAIL · do not execute

STAGE 02 OF 04

Regime Classifier

Hidden Markov model over four states.
Posterior updates every 15 seconds. Kelly multiplier is a function of the most likely regime — same signal, different size.

UPDATE INTERVAL	STATES	SYMBOLS

Kelly $\times 0$ · alerts suppressed

STAGE 03 OF 04

Risk Gate

Four hard budgets. Any one trips and the candidate is rejected — regardless of confluence. The gate is the last word.

Kill switch is a separate path. Engaging it requires a written reason in the journal.

PATCH 0.4 · 2026.05.15

Trust Stack + Operator Console

SHIPPED

01 Journal v1 — structured-reason field for kill-switch engages

Operators must now provide a written reason. Full audit trail per engage / disarm.

JOURNAL

02 Signal console — breaker-state cell added

Operators stopped missing pre-cooldown candidates after the breaker datum landed on the card.

CONSOLE

03 Regime store — migrated to SQLite-backed persistence

Engine restarts no longer lose the HMM posterior. Warm-start in < 200ms.

REGIME

04 Dashboard — React 19 + Tailwind v4 migration

New build pipeline. Bundle down 22%. First paint under one second on cold load.

DASHBOARD

05 Risk Gate — gauge animation + status-pill rewrite

Gauge fill is now a 500ms linear ease. WARNING / CRITICAL transitions read at three feet from the screen.

3 OPEN · ALL SCHEDULED

Known Gaps

None are blocking. All have an owner and a target patch.

WARNING · DS-04

Local design-system mount empty — only .DS_Store on disk.

Source of truth falls back to the GitHub repo. Awkward but functional. Scheduled for p0.5.

WARNING · UI-12

Recharts not bundled in the dashboard UI kit; equity curve is a hand-drawn SVG sparkline.

Production already uses recharts@^2.15.2. Kit will follow once the v3 migration lands upstream.

DEFERRED · BOT-01

No pixel surface for the Telegram bot — @ScoopyAI_bot lives entirely in text.

Intentional for v0.1 — operator config goes through the dashboard. Public bot UI deferred to Q4.

THREE LANES · NO NEW PRODUCTS · FINISH WHAT WE STARTED

Next Quarter

Q2 · IN FLIGHT

Close the gaps

- Resolve DS-04 (local mount)
- Bundle recharts in the UI kit
- Journal v2 — attachments, tags
- Operator config screen

Q3 · PLANNED

Second regime model

- Short-horizon transformer
- Run parallel to HMM for one quarter
- A/B on Kelly multiplier output
- Promotion gate — same features only

Q4 · PLANNED

Open the bot

- @ScoopyAI_bot to waitlist operators
- Per-operator rate limits
- Audit log shared with dashboard
- Public legal page · disclaimer locked

Q&A · GO IN ORDER AROUND THE ROOM

Discussion.

Pause. Write down questions. We'll work through them one by one before standup.
